## **ANALYSIS OF BOTTOM SAMPLES FROM VESTFJORDEN COLLECTED DURING RUMBLE FIRST SEA TRIAL**

### **1 INTRODUCTION**

Project RUMBLE is concerned with measuring bottom roughness by use of low frequency active sonar. During the spring of 2001, the project carried out a sea trial in the Vestfjorden area. As a part of the sea trial 15 sediment samples were taken from two areas in the inner and outer Vestfjorden, respectively. The bottom samples constituted part of the ground truth collected during the sea trial. The bottom samples have been analysed by the Geological Survey of Norway (NGU), and the results are reported in the present document

### **2 MEASUREMENTS**

The RUMBLE first sea trial took place in the Vestfjorden area of Norway from 28 May to 5 June 2001. Two areas were selected for the measurements as shown in figure 2.1. Both areas are squares of 15 by 15 nm. Area A is located in the inner fjord and has a flat bottom with soft sediments. Area B is located at the entrance of the fjord, and is expected to contain harder sediments as well as glacial scouring. The trial plan for the first sea trial is given in [1].

As a part of the trial grab samples were collected in order to investigate surface sediment properties. A total of 15 samples were collected, see figure 2.2. The locations of the samples are listed in table 2.1.

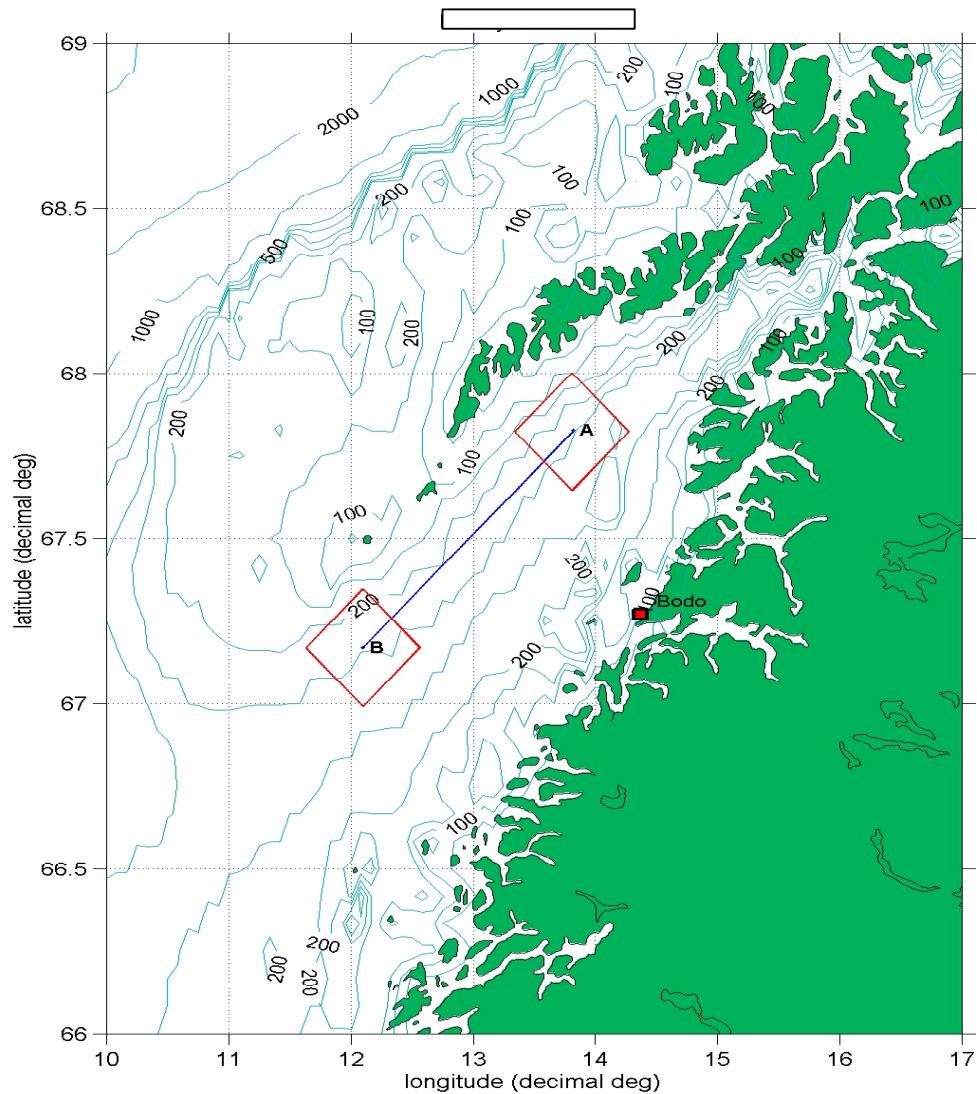

Figure 2.1. RUMBLE first sea trial – working areas.

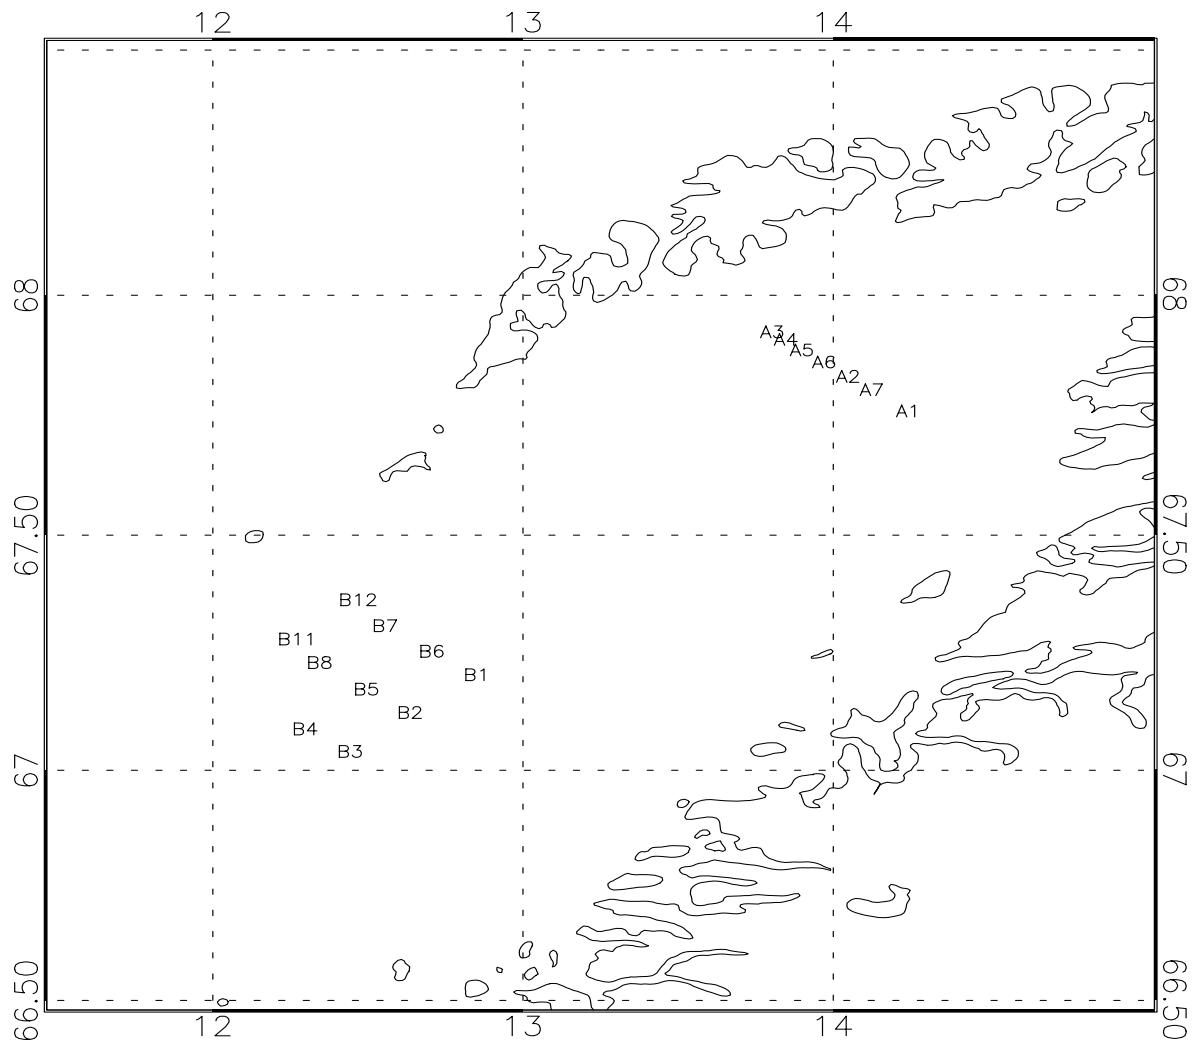

Figure 2.2. Location of grab samples in areas A and B.

Table 2.1: Location of grab samples.

### 3 RESULTS AND DISCUSSION

The grab samples were first roughly classified according to sediment type, and then analysed for grain size distribution [2]. NGU (Geological Survey of Norway) performed the analysis. The method used for the analysis is based on laser diffraction and is described in [3].

A preliminary classification of the grab samples is given in table 3.1. The classification was performed by inspection.

Due to destroyed markings two of the samples (B5 and B8) could not be distinguished with certainty. The samples are denoted by X and Y in the analysis.

| Sample no. | Sediment description   |
|------------|--|
| A1         | Clay   |
| A2         | Clay, 1 cobble (10cm)  |
| A3         | Silt, sandy  |
| A4         | Silt, sandy  |
| A5         | Clay   |
| A6         | Clay   |
| A7         | Clay with gravel (<0.5cm)  |
|            |  |
| B01        | Clay   |
| B02        | Sand, silty with gravel and 1 cobble (10cm). Shell-fragments     |
| B03        | Clay with gravel (<3cm)  |
| B04        | Sand, fine. Some gravel (<0.5cm)                                 |
| B06        | Clay   |
| B07        | Sand, medium with gravel and cobbles (< 7cm). Shell-fragments    |
| B11        | Clay with gravel and cobbles (3-10cm). Shell-fragments           |
| B12        | Sand, coarse/medium with gravel/cobbles (<10cm). Shell-fragments |
| X          | Clay   |
| Y          | Clay   |

*Table 3.1 Preliminary classification of grab samples.*

The results of the grain size analysis [2] are summed up in tables 3.3 and 3.4. Table 3.3 gives the relative content of clay, silt, sand and gravel in the samples, as well as a general description of the sediment type. The relative amount of the different sediment categories within a sample is found from the cumulative grain size distributions, Appendix A and B, by using the sediment categories defined in table 3.2.

Another sediment property of interest is mean grain size. This quantity is extracted from table A.2, and listed in table 3.4.

| Sediment category | Grain size (mm) |
|-------------------|-----------------|
| Clay              | < 0.002         |
| Silt              | 0.002 – 0.060   |
| Sand              | 0.060 – 2.0     |
| Gravel            | > 2.0           |

*Table 3.2 Definition of sediment categories.*

Further details of the grain size analysis are given in Appendix A and B. Appendix A contains tables of cumulative grain size distribution and volume statistics. The results are also presented as plots of the cumulative grain size distribution in Appendix B.

The Coulter Counter grain size analyses normally gives a clay content much less than both the Hydrometer and the Sedigraph methods. This is important to have in mind when the different grab samples are classified. We have tried to compensate for this (at least partly) in the classification of the samples on the basis of the Coulter Counter analysis.

| Sample no. | Clay % | Silt % | Sand % | Gravel % |  | Sediment type                    |
|------------|--------|--------|--------|----------|--|----------------------------------|
| A1         | 15     | 82     | 3      |          |  | Clay, very silty                 |
| A2         | 12     | 72     | 16     |          |  | Clay, very silty, slightly sandy |
| A3         | 6      | 51     | 33     |          |  | Silt, sandy, clayey              |
| A4         | 7      | 37     | 51     | 5        |  | Sand, silty, clayey              |
| A5         | 10     | 64     | 24     | 2        |  | Clay, very silty, sandy          |
| A6         | 11     | 70     | 17     | 2        |  | Clay, very silty, slightly sandy |
| A7         | 12     | 73     | 14     | 1        |  | Clay, very silty, slightly sandy |
| B01        | 12     | 75     | 13     |          |  | Clay, very silty, slightly sandy |
| B02        | 5      | 23     | 61     | 11       |  | Sand, silty, clayey              |
| B03        | 8      | 34     | 55     | 3        |  | Sand, silty, clayey              |
| B04        | 5      | 27     | 65     | 3        |  | Sand, silty, clayey              |
| B06        | 13     | 75     | 12     |          |  | Clay, very silty, slightly sandy |
| B07        | 5      | 24     | 65     | 6        |  | Sand, silty, clayey              |
| B11        | 8      | 36     | 47     | 9        |  | Clay, silty, sandy               |
| B12        | 2      | 11     | 76     | 11       |  | Sand, silty, gravelly            |

Table 3.4 Results of grain size analysis: Mean grain size.

Figures 3.1 and 3.2 show detailed topographic maps of areas A and B. The sediment types of the grab samples collected in the areas are plotted in the maps. Some correlation of sediment type and terrain is found from the figures, although not consistent. In general the flat parts contain the softer sediments, while the sloping parts contain the harder sediments.

The seabed of the area A, figure 3.1, comprises elongated ridges and depressions that were formed under an ice flowing towards southwest along the main axis of Vestfjorden. The ridges and depressions consist of till material, whereas on top of the till surface a rather thin layer of layered sediments (marine/glaciomarine clays) may be found.

The sea bottom of area B, figure 3.2, consists of till material with elongated forms (ridges and depressions) formed under ice flowing towards southwest. In the central, deepest part of the area a few rather circular depressions may be found. The depressions are formed by ice erosion in the underlying till material or bedrock. In the northern part of the area the outer part of a large moraine ridge crossing Vestfjorden (The Tennholmen ridge) is found. This moraine ridge is up to 100 m high, 60 km long and 20 km wide.

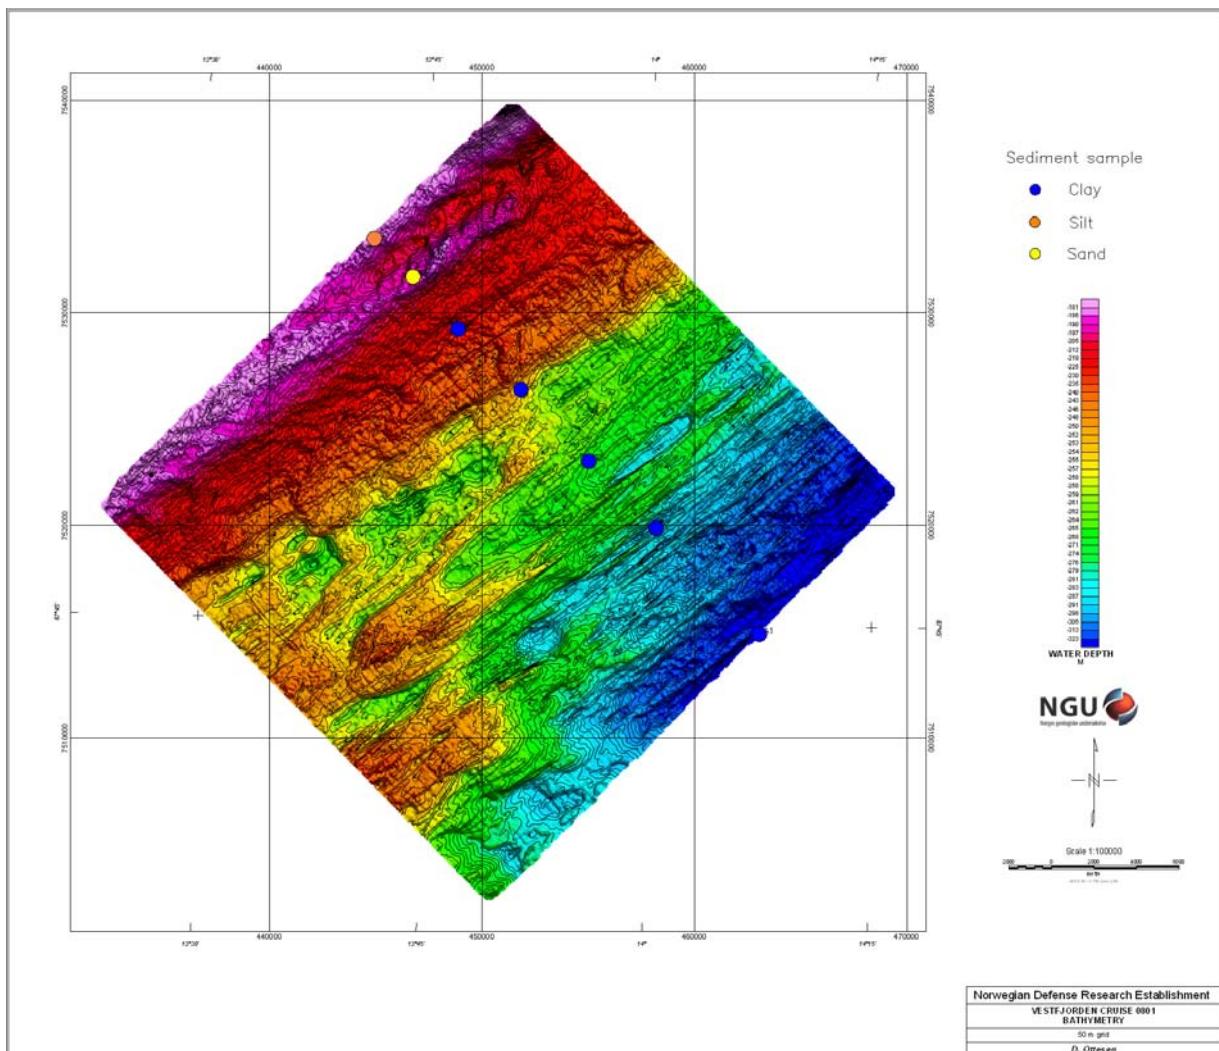

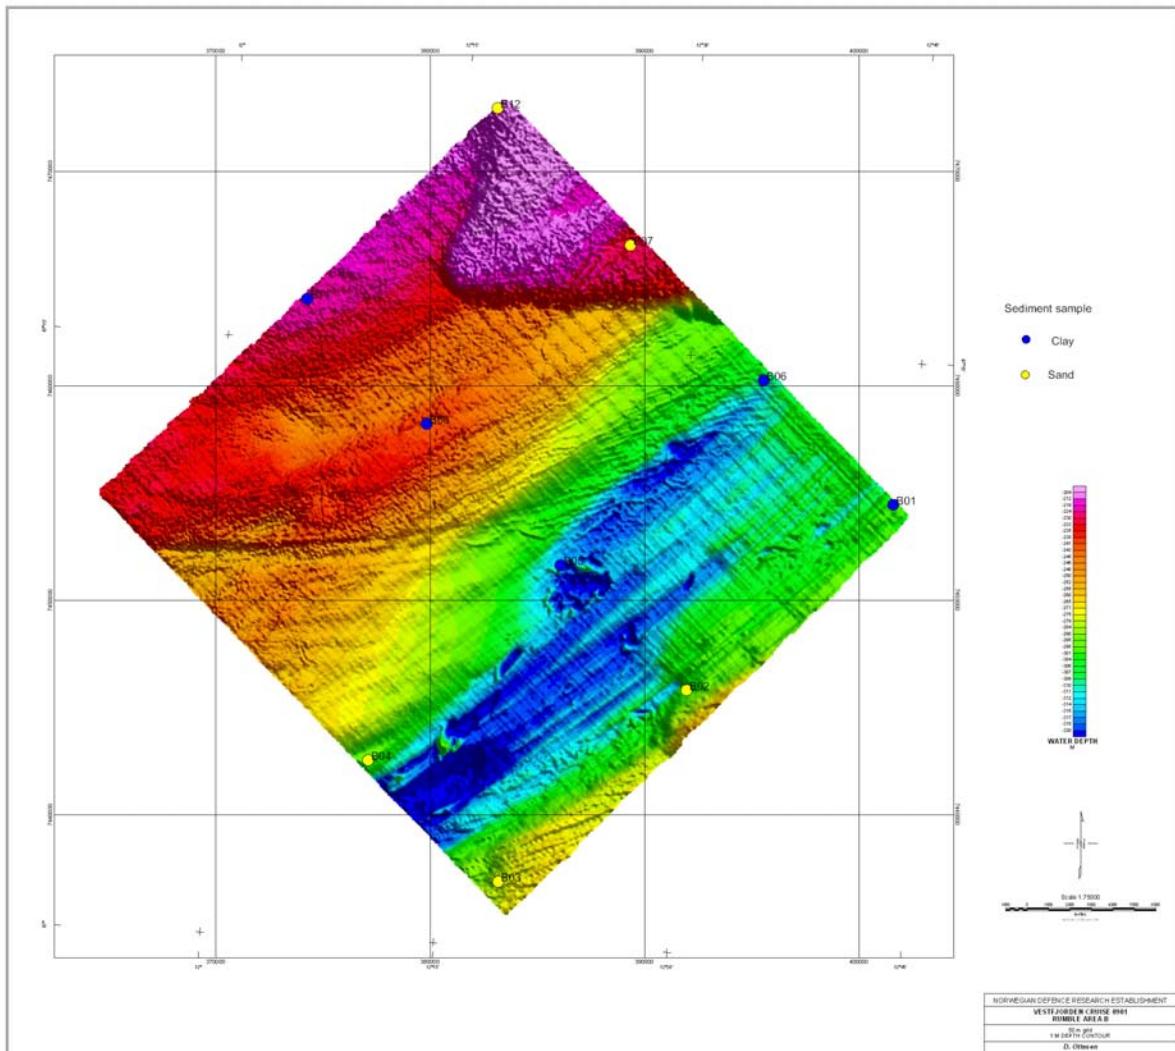

Figure 3.1 Topographic map of area A. Sediment category of grab samples are plotted in the map.

*Figure 3.2 Topographic map of area B. Sediment samples, as classified in table 3.3, are plotted in the map.*

#### 4 CONCLUSIONS

15 samples from the sea bottom from two areas of Vestfjorden have been collected in June 2001, see figure 2.2. Based on grain size analysis, five samples in area A (inner Vestfjorden) have been classified as clay and two samples as sand (silty, clayey). In area B (outer Vestfjorden) three samples have been classified a clay and six as sand.
